(57) **ABSTRACT**

A golf club head according to one or more aspects of the  
present invention may include a main cavity having at least  
one auxiliary cavity and a base surface. An insert may be  
associated with the base surface and may comprise at least  
two contact elements, with a bridge member disposed ther-  
ebetween. Different contact elements of the insert may be  
disposed in separate respective auxiliary cavities, such that  
each contact element may be associated with the base surface.  
The bridge member of the insert may be dissociated from the  
base surface. Moreover, a surface coating may be selectively  
applied to the head to permit a durable adhesive bond between  
the insert and the base surface.

## GOLF CLUB HEAD

## RELATED U.S. APPLICATION DATA

This is a Continuation of application Ser. No. 13/728,036 filed on Dec. 27, 2012, which in turn is a Continuation of application Ser. No. 13/464,100 filed on May 4, 2012, which is a Continuation of application Ser. No. 12/837,806 filed Jul. 16, 2010, which is a Continuation of application Ser. No. 12/071,132 filed Feb. 15, 2008 (now U.S. Pat. No. 7,789,771). The prior applications, including the specifications, drawings and abstracts are incorporated herein by reference in their entirety.

## BACKGROUND

Iron-type golf club heads may generally be classified into “blade” and “perimeter-weighted” categories. Perimeter-weighted iron-type golf club heads may have a substantial concentration of mass distributed behind the striking surface in the form of at least one peripheral wall, sometimes called the perimeter-weighting element. A perimeter-weighted iron-type golf club head may also be referred to as a “cavity-back” iron head, or simply a “cavity-back”, because the perimeter-weighting element thereof generally delimits a cavity in the rear portion of the club head opposite the striking face.

Perimeter-weighted irons are typically more “forgiving” than those of the blade type because the elevated moment of inertia generally associated with perimeter-weighted designs results in decreased head rotation when a ball is mishit, or struck away from the point of orthogonal projection of the club head’s center of gravity onto the striking surface of the iron. Diminished rotation of the club head at impact may increase the accuracy and distance of such mishit shots. Thus, perimeter-weighted irons may substantially benefit less skilled golfers, who are likely to mishit the ball.

Various improvements for cavity-back iron heads, such as localized mass concentrations along the perimeter-weighting element, have been proposed. For example, it is well known that lowering the club head’s center of gravity generally increases ball-launch angle at impact, thus facilitating shots from a variety of lies. Accordingly, sole-weighted cavity-back iron heads help improve ball-launch conditions.

In addition to mass-distribution improvements, a variety of vibration-attenuation technologies have been proposed for cavity-back irons. Some examples comprise a constrained-layer damper positioned behind the striking face within the rear cavity. Others include a resilient insert centrally disposed in the rear cavity. Typically, such inserts are made from materials having vibration-damping characteristics and low density.

However, club heads comprising a resilient insert located in the rear cavity may lack sufficient tactile feedback for a player to distinguish a well-made shot from a mediocre one. In addition, even though club heads fitted with constrained-layer dampers provide abatement of undesirable dynamic-excitation-response modes for a range of mishit shots, unfavorable dynamic-excitation-response modes associated with, e.g., extreme heel and toe mishits for such club heads remain problematic.

## SUMMARY

The present invention, in one or more aspects thereof, may advantageously comprise a golf club head having improved

forgiveness on mishit shots, enhanced tactile feedback, increased structural integrity, and reduced hook/slice tendencies.

In one example, a golf club head according to one or more aspects of the present invention may include a base surface located rearward of the striking surface and an insert associated with the base surface. The insert includes at least two contact elements and a bridge member disposed therebetween. At least a portion of each contact element of the insert may be associated with the base surface of the club head, whereas the bridge member of the insert may be dissociated from the base surface.

In another example, a golf club head according to one or more aspects of the present invention may include an insert and a main cavity comprising a first auxiliary cavity and a second auxiliary cavity. One portion of the insert may be disposed in the first auxiliary cavity and another portion of the insert may be disposed in the second auxiliary cavity.

In another example, a golf club head according to one or more aspects of the present invention may include a rear surface and a main cavity formed in the rear surface. The main cavity may comprise a base surface having an organic coating disposed on less than about 50% of the base surface. Additionally, an insert may be coupled to the base surface by an adhesive.

In yet another example, a golf club head according to one or more aspects of the present invention may be manufactured by providing a semi-finished club head with a rear surface comprising a main cavity including a base surface; placing a masking material on at least about 50% of the base surface; applying an organic to at least a portion of the base surface devoid of the masking material; removing the masking material; and bonding an insert to at least a portion of the base surface.

These and other features and advantages of the golf club head according to the invention in its various aspects as provided by one or more of the examples described in detail below will become apparent after consideration of the ensuing description, the accompanying drawings, and the appended claims. The accompanying drawings are for illustrative purposes only and are not intended to limit the scope of the present invention.

## BRIEF DESCRIPTION OF THE DRAWINGS

Exemplary implementations of the present invention will now be described with reference to the accompanying drawings, wherein:

FIG. 1a is a front perspective view of an exemplary golf club head in accordance with one or more aspects of the present invention.

FIG. 1b is another front perspective view of the golf club head of FIG. 1a.

FIG. 1c is a rear perspective view of the golf club head of FIG. 1a.

FIG. 1d is another rear perspective view of the golf club head of FIG. 1a.

FIG. 1e is another rear perspective view of the golf club head of FIG. 1a.

FIG. 2 is a rear perspective view of an exemplary golf club head in accordance with one or more aspects of the present invention.

FIG. 3 is a rear perspective view of an exemplary golf club head in accordance with one or more aspects of the present invention.

3

FIG. 4 is a rear perspective view of an exemplary golf club head in accordance with one or more aspects of the present invention.

FIG. 5 is a rear perspective view of an exemplary golf club head in accordance with one or more aspects of the present invention.

FIG. 6 is a rear perspective view of an exemplary golf club head in accordance with one or more aspects of the present invention.

FIG. 7a is a rear elevational view of an exemplary golf club head in accordance with one or more aspects of the present invention.

FIG. 7b is a cross-sectional view taken along the lines VIIb-VIIb of FIG. 7a.

FIG. 8 is an exploded rear perspective view of an exemplary golf club head in accordance with one or more aspects of the present invention.

FIG. 8a is a cross-sectional view of a vibration-attenuating feature taken along the lines VIIIa-VIIIa of FIG. 8.

FIGS. 8b and 8c are cross-sectional views of exemplary vibration-attenuating features of an exemplary golf club head in accordance with one or more aspects of the present invention.

FIG. 9 is an exploded rear perspective view of an exemplary golf club head in accordance with one or more aspects of the present invention.

FIG. 10a is an exploded rear perspective view of an exemplary golf club head in accordance with one or more aspects of the present invention.

FIG. 10b is another rear perspective view of the golf club head of FIG. 10a.

FIG. 11 is a front perspective view of an insert for a golf club head in accordance with one or more aspects of the present invention.

FIG. 12 is a rear elevational view of an exemplary golf club head in accordance with one or more aspects of the present invention.

FIG. 13 is a front perspective view of an insert for a golf club head in accordance with one or more aspects of the present invention.

FIG. 14 is a rear perspective view of an exemplary golf club head in accordance with one or more aspects of the present invention.

FIG. 15 is an exploded rear perspective view of an exemplary golf club head in accordance with one or more aspects of the present invention.

FIG. 16 is an exploded rear elevational view of an exemplary golf club head in accordance with one or more aspects of the present invention.

#### DETAILED DESCRIPTION

Referring to FIGS. 1a and 1b, an iron-type golf club head 100, according to one or more aspects of the present invention, may generally comprise a front surface 102 that may be substantially planar over a majority of its area and delimited by a top line 104, a toe 106, a heel 108, and a sole 110. The heel 108 may generally comprise a heel surface 107 and the sole 110 may comprise a sole surface 109. The head 100 may further comprise a hosel 112 for attaching a shaft (not shown) to the head. Referring again to FIG. 1a, the top line 104 may comprise a top line surface 103 and the toe 106 may comprise a toe surface 105.

With reference to FIGS. 1c and 1d, the head 100 may further comprise a rear surface 120 having a main cavity 130. The rear surface 120 may be bounded at its outer extent by the top line surface 103, the toe surface 105, the heel surface 107,

4

and the sole surface 109. The main cavity 130 includes a base surface 132, surrounded, at least in part, by a perimeter surface 134, extending from the base surface 132 to the rear surface 120. The club head 100 may also comprise a perimeter weighting element 140, defined by the volume of material bounded by the perimeter surface 134, the rear surface 120, the top line surface 103, the toe surface 105, the heel surface 107, and the sole surface 109.

With reference to FIG. 1e, the main cavity 130 of the exemplary golf club head 100 may further comprise at least one auxiliary cavity, e.g., auxiliary cavities 150a and 150b. Each auxiliary cavity may be delimited by a perimeter wall, e.g., the perimeter walls 154a and 154b, a perimeter surface 134, and a base surface 132. While the auxiliary cavities are shown generally opposite the sole surface 109, these cavities may be located opposite any portion of the top line surface 103, the toe surface 105, the heel surface 107, and/or the sole surface 109.

As shown in FIG. 2, an exemplary golf club head 200, according to one or more aspects of the present invention, may comprise a main cavity 230 bounded by a base surface 232 and a perimeter surface 234. At least one auxiliary cavity, e.g., auxiliary cavities 250a and 250b, may be disposed in the perimeter surface 234. The auxiliary cavities 250a and 250b may be bounded by side walls 255a and 255b, respectively, and bottom surfaces 257a and 257b, respectively. Although the cavities are shown to be disposed generally opposite a sole surface 209, the cavities may be located opposite any portion of a top line surface 203, a toe surface 205, a heel surface 207, and/or the sole surface 209. As illustrated in FIG. 3, auxiliary cavities, e.g., cavities 350a and 350b, may be bounded by side walls 355a and 355b, respectively, bottom surfaces 357a and 357b, respectively, and portions of a base surface 332.

Referring to FIG. 4, an exemplary golf club head 400, according to one or more aspects of the present invention, may comprise a main cavity 430 bounded by a base surface 432 and a perimeter surface 434. At least one auxiliary cavity, e.g., auxiliary cavities 450a and 450b, may be bounded by side walls 455a and 455b, respectively, perimeter walls 454a and 454b, respectively, bottom surfaces 457a and 457b, respectively, and portions of a base surface 432. Although the auxiliary cavities are shown to be disposed generally opposite a sole surface 409, the cavities may be located opposite any portion of a top line surface 403, a toe surface 405, a heel surface 407, and/or the sole surface 409.

With reference to FIG. 5, an exemplary golf club head 500, according to one or more aspects of the present invention, may comprise a main cavity 530 having a single auxiliary cavity 550. The cavity 550 may be bounded by a perimeter wall 554, a perimeter surface 534, and a base surface 532. Although the auxiliary cavity is shown to be disposed generally opposite a sole surface 509, the cavity may be located opposite any portion of a top line surface 503, a toe surface 505, a heel surface 507, and/or the sole surface 509.

As shown in FIG. 6, a golf club head 600, according to one or more aspects of the present invention, may comprise a main cavity 630 having at least one auxiliary cavity, e.g., auxiliary cavities 650a and 650b. The cavities 650a and 650b may be bounded by a perimeter surface 634, portions of a base surface 632, and perimeter walls 654a and 654b, respectively, having a shared portion 668. Although the auxiliary cavities are shown to be disposed generally opposite a top line surface 603, the cavities may be located opposite any portion of a sole surface 609, a toe surface 605, a heel surface 607, and/or the top line surface 603.

As shown in FIGS. 7a and 7b, a golf club head 700, according to one or more aspects of the present invention, may

5

comprise a main cavity **730** having three or more auxiliary cavities, e.g., auxiliary cavities **750a-d**. Each auxiliary cavity may be bounded by a base surface **732**, a perimeter surface **734**, and a perimeter wall, e.g., one of auxiliary perimeter walls **754a-d**. The reinforcement of the base surface **732** provided by the perimeter walls of the auxiliary cavities may deliver improved dynamic-excitation response of the club head at ball impact. As described in detail below, additional elements may be incorporated into the club head to further enhance the dynamic-excitation response thereof.

Referring to FIG. **8**, a golf club head **800**, according to one or more aspects of the present invention, may comprise a main cavity **830** having at least one auxiliary cavity, e.g., auxiliary cavities **850a-d**. To improve the dynamic-excitation response of the head at ball impact, at least one vibration-attenuating feature may be disposed in at least one of the main cavity and the auxiliary cavities. For example, the vibration-attenuating feature may be a constrained-layer damper **880a** that conforms to the shape of the main cavity **830**. Examples of constrained-layer dampers are described in U.S. Pat. No. 5,316,298, which is hereby incorporated by reference.

The constrained-layer damper **880a** is provided to improve the dynamic-excitation response of a golf club head at ball impact. Referring to FIG. **8a**, damper **880a** may include at least one constraining member **882a** and a visco-elastic layer **884a**. The layer **884a** may comprise a visco-elastic stratum having, e.g., 3M™ VHB™ Adhesive Transfer Tape 9469. The damper **880a** may be attached to the base surface **832** (FIG. **8**) via the adhesive surface of the visco-elastic layer **884a**.

Referring to FIGS. **8b** and **8c**, constrained-layer dampers having a three-dimensional topography are illustrated. As shown in FIG. **8b**, a damper **880b** may comprise a non-planar constraining member **882b**, a variable-thickness intermediate layer **886b**, and a visco-elastic layer **884b**. The intermediate layer **886b** may include a non-planar surface **888b**, complementing the corresponding mating surface of the constraining member, and an opposing substantially flat surface **890b**. The intermediate layer **886b** may be co-molded with the constraining member **882b** or may be attached thereto, e.g., by an adhesive. The intermediate layer **886b** may be a polymer, e.g., a two-part polyurethane such as MF440 resin activated by DK124HV hardener, or any other suitable material. The visco-elastic layer **884b** may comprise, e.g., 3M™ VHB™ Adhesive Transfer Tape 9469.

In another example, a constrained-layer damper **880c**, shown in FIG. **8c**, may comprise a variable-thickness constraining member **882c** and a visco-elastic layer **884c** having adhesive surfaces. The constraining member may include a non-planar exterior surface **892c** and an opposing substantially flat surface **890c**. The constraining member **882c** may be manufactured from a variety of materials including, but not limited to, plastics, metals, and composites.

The club head, according to one or more aspects of the invention, may be provided with additional features to improve the dynamic-excitation response for mishit shots. As shown in FIG. **9**, an exemplary golf club head **900** may comprise a main cavity **930** having at least one auxiliary cavity, e.g., auxiliary cavities **950a-c**. An insert **920**, disposed in the auxiliary cavity **950a**, may abut a base surface **932**, a perimeter surface **934**, and/or a perimeter wall **954**. The insert **920** is provided, at least in part, for abatement of unfavorable vibrations, associated, e.g., with mishit shots. A secondary vibration-attenuating feature, e.g., a constrained-layer damper **980**, may also be introduced to further improve the damping properties of the club head **900**.

In another example, a golf club head **1000**, shown in FIGS. **10a** and **10b**, may comprise a main cavity **1030** having at least

6

two auxiliary cavities, e.g., auxiliary cavities **1050a-d**. The club head **1000** may further comprise an insert **1020** having at least two contact elements, e.g., toe element **1022** and heel element **1023**, and a bridge member **1024** disposed therebetween. Referring to FIG. **10b**, the insert **1020** may be at least partially disposed in at least two auxiliary cavities, e.g., the auxiliary cavities **1050a** and **1050b**. For example, the heel element **1023** may be positioned in the auxiliary cavity **1050a** and the toe element **1022** may be positioned in the auxiliary cavity **1050b**. Preferably, the at least two contact elements abut a base surface **1032** of the main cavity. The bridge member **1024** may be dissociated from the base surface **1032** for the purposes of tuning the dynamic-excitation response of the club head, particularly for mishit shots. A secondary vibration-attenuating feature, e.g., constrained layer damper **1080**, may also be provided to further improve the damping properties of the club head.

The insert **1020** may be made from a resilient material having a Shore hardness from about 50 A to about 75 D to provide a soft tactile sensation. In another example, the resilient material may have a Shore hardness from about 60 A to about 80 A. The tactilely perceptible softness of the insert may communicate to the golfer an improvement in the dynamic-response characteristics of the golf club head at ball impact, thus promoting increased player confidence in the equipment. Examples of the resilient materials suitable for fabricating the insert **1020** may include polyurethane, silicone, ABS, Nylon, polycarbonate (PC), polypropylene (PP), polyethylene (PE), thermoplastic rubber (TPR), thermoplastic vulcanizate (TPV), thermoplastic elastomers (TPE), and natural rubber. In another example, the insert **1020** may be made from thermoplastic polyurethane (TPU) having a Shore hardness between about 65 A and about 75 A. The specific gravity of the insert may depend on the material selected and may generally be between about 0.8 and about 2.0. Alternatively, the material selected may be densified by blending the resilient material with a higher-density powdered material, e.g., tungsten, prior to the formation of the insert **1020**. The specific gravity of the densified insert may be in a range from about 0.8 to about 15. The insert may therefore be used to alter the weight distribution of the club head.

Referring again to FIGS. **10a** and **10b**, the insert **1020** may be bonded to the head **1000** using, e.g., an epoxy-type adhesive. The adhesive may be applied to the base surface **1032**, the perimeter surface **1034**, and the interior surfaces of two perimeter walls **1054a** and **1054b**.

Referring to FIG. **11**, an insert, according to one or more aspects of the present invention, e.g., an insert **1120**, may comprise one or more ridges **1128** on at least one of the at least two contact elements, e.g., a toe element **1122** and a heel element **1123**. The gaps between the ridges may help reduce adhesive “squish-out” when fitting the insert to the club head during assembly. Moreover, the ridges **1128** may promote a stronger bond between the club head and the insert by increasing the area of the bonding interface. As shown in FIG. **11**, the ridges **1128** may be disposed on the insert in any desired orientation.

In another aspect of the present invention, a golf club head **1200**, shown in FIG. **12**, may comprise a main cavity **1230**, having at least three auxiliary cavities, e.g., auxiliary cavities **1250a-d**, and a central cavity **1250e**. The auxiliary cavities **1250a-d** may serve as examples of first through fourth cavities or partitions, and the central cavity **1250e** may serve as an example of a fifth cavity or partition. The club head **1200** may further comprise an insert **1220**, having at least three contact elements, e.g., toe elements **1222a**, **1222b** and heel elements **1223a**, **1223b**, with a bridge member **1224** disposed therebetween.

tween. As shown in FIG. 12, the insert 1220, illustrated by hatching, may be at least partially disposed in at least three auxiliary cavities. For example, the heel elements 1223a and 1223b may be positioned in the auxiliary cavities 1250a and 1250c, respectively, and the toe elements 1222a and 1222b may be positioned in the auxiliary cavities 1250b and 1250d, respectively. Preferably, the at least three contact elements are in contact with a base surface 1232 of the main cavity. As shown in FIG. 12, the heel elements 1223a, 1223b and the toe elements 1222a, 1222b of the insert 1220 may cover, or span, the entire base surface 1232 of the auxiliary cavities 1250a-d. The bridge member 1224 may be dissociated, or separate, from the base surface 1232 for the purposes of tuning the dynamic-excitation response of the club head, particularly on mishit shots.

According to the USGA Rules, all parts of a golf club head must be fixed. In other words, no part of a golf club head may exhibit movement relative to any other part thereof when subject to an external force. Absent additional underpinnings, the bridge members of the exemplary inserts, described above with reference to FIGS. 10a-12, may deflect when subjected to external forces. For example, referring to FIG. 10b, the bridge member 1024 may deflect toward the base surface 1032 when a force is applied to the bridge member in the direction of the base surface. As shown in FIGS. 13-15, auxiliary elements may be incorporated into the club head and/or the insert to substantially inhibit movement of the insert relative to the club head.

With reference to FIG. 13, an insert 1320, according to one or more aspects of the present invention, may comprise at least two contact elements, e.g., heel element 1322 and toe element 1323, with a bridge member 1324 disposed therebetween. The insert 1320 may further comprise a stiffening member 1326 extending, e.g., from the heel element 1322 to the toe element 1323 along the bridge member 1324. The stiffening member 1326 may be flush with the insert 1320, at least in part, recessed, at least in part, and/or salient, at least in part. Regardless of the configuration, the stiffening member 1326 is provided to prevent the insert 1320 from deflecting, e.g., more than about 1 mm (0.040 in.) relative to the club head with the application of about 45 N (10 lb) of force. The applied force should generally correspond to the typical force delivered by the thumb of a golfer or a golf official who may wish to test the head for conformance with the applicable rules of golf.

Referring again to FIG. 13, the stiffening member 1326 may be formed from a polymeric material, such as ABS, Nylon, PVC, Polystyrene, Polypropylene, High Density Polyethylene, glass- or carbon-fiber-reinforced plastic, or the like. Metallic materials, e.g., aluminum, steel, magnesium, titanium, or the like, may also be used. In general, the material selected should provide sufficient stiffness to realize the deflection criteria discussed above. In one example, the stiffening member 1326 may be attached to the insert 1320, e.g., by adhesive bonding or other known methods. Alternatively, the parts of the insert may be integrally co-molded.

In another example, shown in FIG. 14, a golf club head 1400, according to one or more aspects of the present invention, may comprise a main cavity 1430, having a perimeter surface 1434 and a stiffening member 1426 disposed on the perimeter surface. As shown in FIG. 14, the stiffening member 1426 may have an arch-like configuration for buttressing the bridge member of any exemplary insert described with reference to FIGS. 10a, 10b, 11, 12, and 13 above. Such a construction may sufficiently stiffen such an insert to conform to the rules of golf. The stiffening member may be formed separately from the head 1400 and may be attached

thereto, e.g., by adhesive bonding, welding, or other joining techniques. Alternatively, the stiffening member may be cast integrally with the head. Adhesives may be employed at the interface between the insert and the stiffening member 1426 to further stabilize and anchor the insert to the club head.

With reference to FIG. 15, a golf club head 1500, according to one or more aspects of the present invention, may comprise an insert 1520 and a perimeter surface 1534 having a stiffening member 1526. The stiffening member 1526 may protrude from the perimeter surface 1534 for engagement with a complementary opening 1527 formed in the insert 1520. Engagement of the insert 1520 with the stiffening member 1526 substantially vitiates the deflection of the insert relative to the club head. As shown in FIG. 15, the stiffening member 1526 and the complimentary opening 1527 may, for example, comprise generally rectangular shapes. As described above, adhesives may be employed at the interface between the insert 1520 and the stiffening member 1526 to further stabilize and anchor the insert to the club head.

It may also be desirable to enhance the cosmetic appeal of the club head, according to one or more aspects of the present invention, with the use of organic surface coatings, e.g., paint or the like. However, the application of such coatings to the club head may lead to a weak bond between the club head and any supplementary vibration-attenuation components, such as those described above. Thus, specific preparation of the club head surface is necessary for the durability of any adhesive bond between the club head and its bonded components. Such surface preparation may include cleaning the head with solvents or other chemicals and subsequently treating any surfaces that will have an adhesive and/or coating applied thereto with an abrasive medium. Organic surface coatings should be applied to the head prior to the attachment of any supplementary components to avoid staining the supplementary components with the coating.

Referring to FIG. 16, a golf club head 1600, according to one or more aspects of the present invention, may comprise a main cavity 1630 having a base surface 1632 and at least one auxiliary cavity, e.g., auxiliary cavities 1650a-d. Subsequent to any desired surface preparation step, such as the exemplary steps described above, one or more sections of a masking material 1611 may be applied to at least a portion of one or more regions of the main cavity 1630, where at least one supplementary component will subsequently be adhesively bonded. The masking material 1611 may be configured to cover at least about 50% of one or more regions of the base surface 1632 where at least one supplementary component will be attached. In other examples, the masking material may cover at least about 60% of one or more of the above-mentioned regions or at least about 80% of the above-mentioned regions. The organic surface coating 1652 is then applied to the portion of the club head that is devoid of the masking material 1611. Following the application of the organic coating, the masking material is removed. The supplementary components, such as inserts and/or constrained-layer dampers, are then coupled to the desired regions of the base surface 1632 having areas devoid of the organic coating, thus promoting a durable bond between the club head and any such supplementary component.

In the foregoing specification, the invention has been described with reference to specific exemplary aspects thereof. It will, however, be evident that various modifications and changes may be made thereto without departing from the broader spirit and scope of the invention as set forth in the appended claims. The specification and drawings are, accordingly, to be regarded in an illustrative rather than a restrictive sense.

The invention claimed is:

**1.** A cavity-back iron-type golf club head comprising:

a striking face;

a toe portion;

a heel portion;

a top line portion;

a sole portion; and

a perimeter weighting element, at least a portion of which is positioned opposite the striking face, the perimeter weighting element defining at least an outer portion of:

a first cavity positioned proximal to the sole portion and the heel portion of the club head, and distal to the top line portion and the toe portion of the club head,

a second cavity positioned adjacent the first cavity, the second cavity being positioned proximal to the sole portion and the toe portion of the club head, and distal to the top line portion and the heel portion of the club head,

a third cavity positioned proximal to the heel portion and distal to the toe portion, and

a fourth cavity positioned proximal to the toe portion and distal to the heel portion,

wherein at least two of the cavities are at least partially filled with a material having a specific gravity in the range of 0.8 to about 15 and at least two of the cavities are substantially unfilled and visually exposed.

**2.** The cavity-back iron-type golf club head of claim 1, further comprising a fifth cavity positioned closer to the top line than at least the first cavity and the second cavity.

**3.** The cavity-back iron-type golf club head of claim 2, wherein the fifth cavity substantially spans between the heel portion and the toe portion of the club head, and

wherein the fifth cavity has a bottom surface area that is at least 15% of the total surface area of the striking face.

**4.** The cavity-back iron-type golf club of claim 3, wherein a constrained layer is disposed within the fifth cavity.

**5.** The cavity-back iron-type golf club head of claim 4, wherein the constrained layer is visually exposed.

**6.** The cavity-back iron-type golf club head of claim 1, wherein a portion of the third cavity is closer to the first cavity than the second cavity, and

wherein a portion of the fourth cavity is closer to the second cavity than to the first cavity.

**7.** The cavity-back iron-type golf club head of claim 1, wherein the specific gravity of the material is in the range of 0.8 to 2.0.

**8.** The cavity-back iron-type golf club head of claim 1, wherein the material is tungsten.

**9.** A cavity-back iron-type golf club head comprising:

a striking face;

a perimeter weighting element having a top-line portion, a sole portion, a heel portion, and a toe portion such that each portion extends rearwardly from the striking face, the perimeter weighting element defining, at least in part, a boundary of:

a first auxiliary cavity,

a second auxiliary cavity distinct from the first auxiliary cavity, the first auxiliary cavity and the second auxiliary cavity being proximal to the sole portion and distal to the top-line portion,

a third auxiliary cavity distinct from the first auxiliary cavity and the second auxiliary cavity, the third aux-

iliary cavity being positioned proximal to the heel portion and distal to the toe portion,

a fourth auxiliary cavity distinct from the first auxiliary cavity, the second auxiliary cavity, and the third auxiliary cavity, the fourth auxiliary cavity being positioned proximal to the toe portion and distal to the heel portion, and

a main cavity distinct from the first auxiliary cavity, the second auxiliary cavity, the third auxiliary cavity, and the fourth auxiliary cavity, the main cavity substantially spanning between the heel portion and the toe portion; and

a constrained element having a non-planar exterior surface, the constrained element being disposed substantially entirely within the main cavity and held in place with an adhesive, a substantial portion of the constrained element being visually exposed,

wherein at least two of the auxiliary cavities are at least partially filled with an insert material comprising tungsten and at least two of the auxiliary cavities are substantially unfilled and visually exposed.

**10.** The cavity-back iron-type golf club head of claim 9, wherein the first auxiliary cavity is proximal to the heel portion and distal to the toe portion, and the second auxiliary cavity is proximal to the toe portion and distal to the heel portion.

**11.** The cavity-back iron-type golf club head of claim 10, wherein the main cavity has a bottom surface area that is at least 15% of a total surface area of the striking face.

**12.** A cavity-back iron-type golf club head, comprising:

a plurality of cavities positioned opposite a striking face of the club head,

a first of the cavities being positioned proximal to a sole and a heel of the club head, and distal to a top line and a toe of the club head,

a second of the cavities being positioned proximal to the sole and the toe, and distal to the top line and the heel, a third of the cavities being positioned proximal to the heel and distal to the toe, closer to the first cavity than to the second cavity,

a fourth of the cavities being disposed proximal to the toe and distal to the heel, closer to the second cavity than to the first cavity, and

a fifth of the cavities substantially spanning from the heel to the toe, at least a portion of the fifth cavity being positioned closer to the top line than the first and second cavities;

a constrained layer disposed within the fifth cavity so that the constrained layer is visually exposed; and a tungsten-containing insert portion disposed in at least one of the plurality of cavities.

**13.** The cavity-back iron-type golf club head of claim 12, wherein the tungsten-containing insert portion is disposed in one of the first and third cavities and another tungsten-containing insert portion is disposed in one of the second and fourth cavities, and

wherein the other of the first and third cavities and the other of the second and fourth cavities are substantially unfilled and visually exposed.
